Ex no.3 Survey Report on Emerging Trends in Low-Code Application Developmen

AIM

To conduct a survey on the **emerging trends in Low-Code Application Development** and understand how modern low-code platforms are improving application development through artificial intelligence, automation, cloud integration, data analytics, and reusable components.

THEORY

Low-Code Application Development is an approach that enables software applications to be developed using **visual interfaces, drag-and-drop components, pre-built templates, workflows, database connectors, and minimal programming**.

Modern low-code platforms are evolving beyond simple form builders and are increasingly incorporating advanced technologies such as **Artificial Intelligence, Machine Learning, cloud computing, APIs, automation, analytics, and mobile development**.ols.

PROCEDURE

1. Identify the concept and purpose of Low-Code Application Development.
2. Study the major features provided by modern low-code platforms.
3. Identify emerging technologies being integrated with low-code platforms.
4. Study trends such as AI assistance, cloud integration, automation, analytics, APIs, and mobile development.
5. Analyze how these technologies simplify application development.
6. Study the use of low-code development in business applications.
7. Relate the identified trends to the **Vehicle Service & Repair Request Management application** developed using Zoho Creator.

8. Analyze the use of forms, workflows, reports, charts, pivot tables, calendar views, and other visual components.
9. Compare the benefits of modern low-code development with traditional application development.
10. Summarize the major emerging trends and their impact on application development.

RESULT

Thus, the survey concludes that emerging low-code technologies can simplify application development, reduce repetitive programming work, and enable faster development of business-oriented applications.
