Experiment No. 8: User Management and Role-Based Access Control

1. AIM

To study user management and implement role-based access control (RBAC) in Zoho Creator.

2. THEORY

User management in Zoho Creator allows administrators to add users, assign roles, and control access to applications. Role-Based Access Control (RBAC) grants permissions based on a user's assigned role.

Common roles include:

- **Administrator:** Full control over the application.
- **Developer:** Creates and modifies application components.
- **User:** Accesses permitted forms and reports.

RBAC improves security by ensuring users can access only the information and features required for their responsibilities.

3. PROCEDURE

1. Log in to Zoho Creator and open the required application.
2. Navigate to the application's **Users and Permissions** or user-management settings.
3. Add users or invite existing users to the application.
4. Create roles such as Administrator, Service Manager, and Customer.
5. Assign suitable permissions to each role.
6. Configure access to forms, reports, and application data.
7. Assign roles to users.
8. Test the application using different user accounts to verify their access permissions.

4. EXAMPLE

In a Vehicle Service Management application:

- **Administrator:** Manages users, forms, reports, and records.
- **Service Manager:** Views service requests and updates repair status.

- **Customer:** Submits service requests and views permitted details.

5. RESULT

User management and role-based access control were studied in Zoho Creator. Different roles and permissions help protect application data and ensure secure access.
